

## Downloading COVID-19 data and analysing it using Excel

Go to the European [Centre for Disease Prevention and Control](#) and download the Excel file that contains the most recent data on the worldwide, geographic distribution of COVID-19 infections.

Before we download data from a portal like this one, always read about the file to make sure you understand what you're getting. Typically, this information is contained in a "readme" file or data dictionary that can be downloaded or read on the site.

In this case, the explanation – also called a "nerd box" by data-journalists – is one of the first things you notice on the website that was last accessed on Oct 28.

# Download the daily number of new reported cases of COVID-19 by country worldwide

Table

28 Oct 2020

The downloadable data file is updated daily and contains the latest available public data on COVID-19. Each row/entry contains the number of new cases reported per day and per country. You may use the data in line with ECDC's copyright policy.

## Download

 [Download today's data on the geographic distribution of COVID-19 cases worldwide as of 28 October 2020 - EN - \[XLSX-2.86 MB\]](#)

 [Download today's data on the geographic distribution of COVID-19 cases worldwide - EN - \[XLSX-2.86 MB\]](#)

From the explanation, we learn that each row of information in the spreadsheet represents a daily count, snapshots of infections and deaths.

This explanation is crucial if we are to make sense of the table we're about the download.

After you have read the explanation, download the file.

## Download the daily number of new reported cases of COVID-19 by country worldwide

Table  
28 Oct 2020

The downloadable data file is updated daily and contains the latest available public data on COVID-19. Each row/entry contains the number of new cases reported per day and per country. You may use the data in line with ECDC's copyright policy.

### Download

 [Download today's data on the geographic distribution of COVID-19 cases worldwide as of 28 October 2020 - EN - \[XLSX-2.86 MB\]](#)

[Download today's data on the geographic distribution of COVID-19 cases worldwide - EN - \[XLSX-2.86 MB\]](#)

Be sure to save it in a folder you have created for this exercise.

Open the Excel file, which will look similar this earlier version.

One of the first things we will do is copy the URL for the centre’s site and paste it into the table’s first available cell.

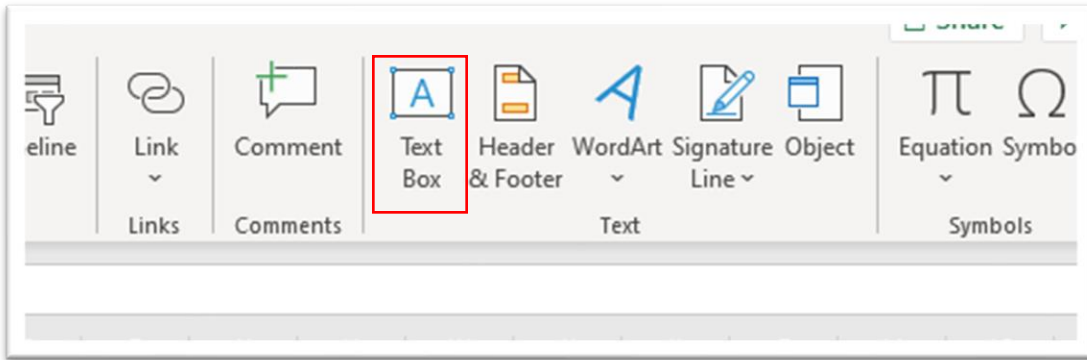

dateRep	day	month	year	cases	deaths	countries:geoid	country:countrycode	popData2:continent	Cumulative_number_for_14_days_of_COVID-19_cases_per_100000	https://www.ecdc.europa.eu/en/publications-data/download-todays-data-geographic-distribution-covid-19-cases-worldwide
2020-10-28	28	10	2020	113	7	Afghanistan:AF	AFG	38041757 Asia	3.025623	
2020-10-27	27	10	2020	199	8	Afghanistan:AF	AFG	38041757 Asia	2.902074	
2020-10-26	26	10	2020	65	3	Afghanistan:AF	AFG	38041757 Asia	2.718066	
2020-10-25	25	10	2020	81	4	Afghanistan:AF	AFG	38041757 Asia	2.799555	

This is good practice that ensures you always know the origin of the data.

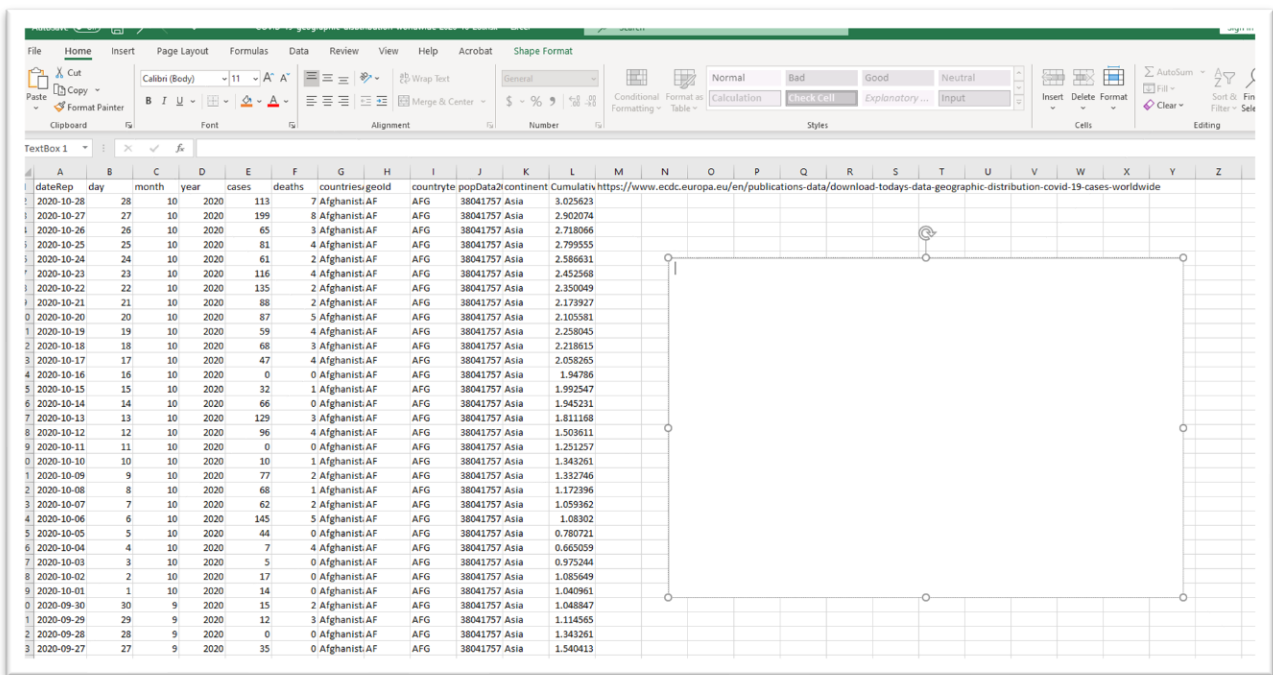

And remember that “nerd box”, let’s copy and embed that explanation into this worksheet.

Click “Insert” on the menu across the top and scroll across to your right to the “Text section”.

Hover your mouse over the “Text Box” icon.

Place your mouse – which turns into a cross-like icon -- anywhere to the right of the table, hold the mouse down with your index finger and draw a box large enough to contain the nerd box explanation.

Paste the explanation.

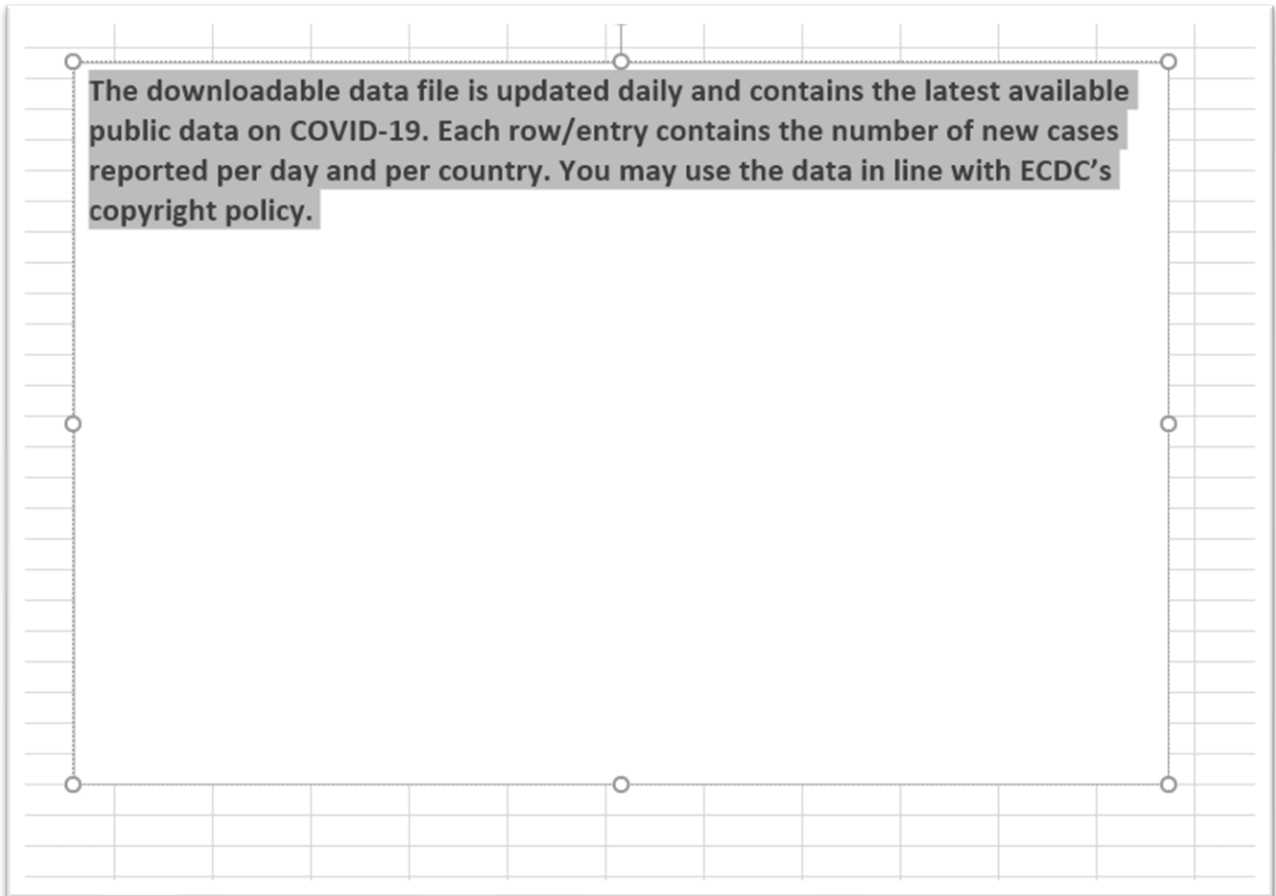

The screenshot shows an Excel spreadsheet with a table of COVID-19 data for Afghanistan. The table has columns for date, cases, deaths, and cumulative totals. A text box is overlaid on the right side of the spreadsheet, containing a disclaimer about the data's source and copyright policy.

The downloadable data file is updated daily and contains the latest available public data on COVID-19. Each row/entry contains the number of new cases reported per day and per country. You may use the data in line with ECDC's copyright policy.

Our text box is akin to a Word document in our spreadsheet which can be expanded to fit as much text as you would like. They are handy, especially when you're sharing information with colleagues that might require some quick context. Feel free to increase the point size by highlighting the paragraph and increasing the font size, just like you

would in a Word document.

You can even make the box smaller by placing your cursor over small circle in the middle of the bottom boundary and moving it upwards.

Now you have the website's URL and a quick explainer.

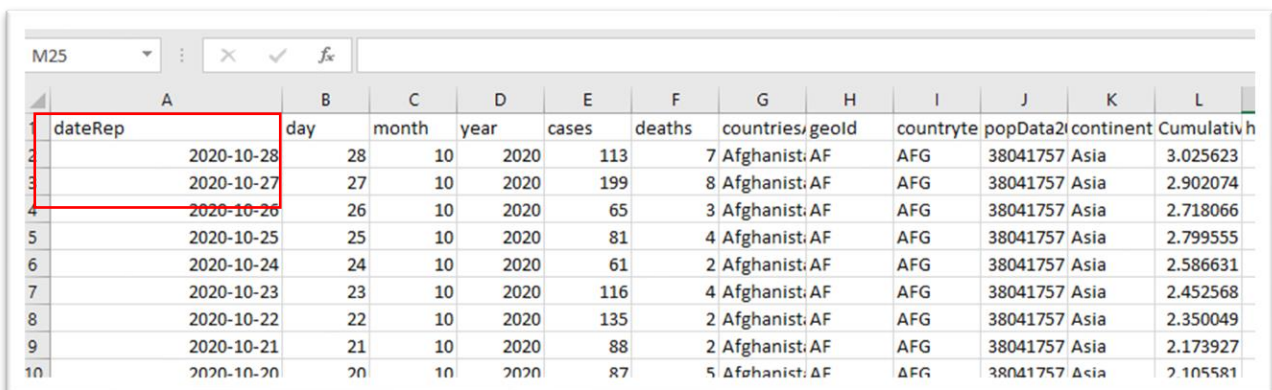

Save this table as a back-up, a crucial step that must be followed to avoid potential tears if disaster ever strikes.

Now we will take a few minutes to analyze what the information in the table can tell us, and just as importantly what it can't.

Let's begin with what it can tell us.

Adjust the column widths to read the column titles.

	A	B	C	D	E	F	G	H	I	J	K	L
1	dateRep	day	month	year	cases	deaths	countries;geold	countryte	popData2	continent	Cumulative	h
2	2020-10-28	28	10	2020	113	7	Afghanistan;AF	AFG	38041757	Asia	3.025623	
3	2020-10-27	27	10	2020	199	8	Afghanistan;AF	AFG	38041757	Asia	2.902074	
4	2020-10-26	26	10	2020	65	3	Afghanistan;AF	AFG	38041757	Asia	2.718066	
5	2020-10-25	25	10	2020	81	4	Afghanistan;AF	AFG	38041757	Asia	2.799555	
6	2020-10-24	24	10	2020	61	2	Afghanistan;AF	AFG	38041757	Asia	2.586631	
7	2020-10-23	23	10	2020	116	4	Afghanistan;AF	AFG	38041757	Asia	2.452568	
8	2020-10-22	22	10	2020	135	2	Afghanistan;AF	AFG	38041757	Asia	2.350049	
9	2020-10-21	21	10	2020	88	2	Afghanistan;AF	AFG	38041757	Asia	2.173927	
10	2020-10-20	20	10	2020	87	5	Afghanistan;AF	AFG	38041757	Asia	2.105581	

Notice that the numbers in a number of columns -- A, B, C, D, E, F and J -- are all justified to the right. This means that Excel has correctly interpreted them as numbers. This is important because spreadsheets can only perform calculations -- summing, counting, averages, etc. -- on numbers. The content in columns G, H, I and K are left-justified, meaning they are text. If your numbers are left-justified, which can happen when downloading data from the internet, you would have to do a bit of reformatting or cleaning. Fortunately, this data set is clean, tidy, and good to go.

The dates in column A are sorted in descending order with the most recent period at the top. As this table was downloaded on Wednesday Oct. 28, 2020, that is the day of the most recent entry in cell A2.

The three cells to the right, represent the components of the date: day, month, and year. Again, this is excellent for analysis because we may want to group days or certain months to determine the virus's most deadly period.

Sticking with numbers, you will also notice that column J contains the country's population figure. This will come in handy when we perform calculations such as deaths rate which allow for country-to-country comparisons.

There is also a lot this table cannot tell us: Where are the country's hotspots? What parts of the population are being the most affected? And are the number of tests affecting the cases and deaths? What about neighbourhoods and schools which are now the subject of a lot of worry as B.C., Ontario and Quebec are caught in the feared second wave which, while not as deadly as the first wave, is still concerning.

You won't find these answers in the nerd box or the table we have just downloaded. If nothing is available on the website, you may have to try to connect with the individual responsible for the data. The rules governing open-data policies work off the premise that data should be open by default. Governments typically provide mere subsets of larger datasets they possess. So, if something appears to be missing, there is a chance it may be available for the asking. Don't be shy.

Another key question is who updates and verifies the data? What government agencies send their death and infection numbers to the centre? Indeed, there's checklist of questions that should be answered

before we go much further, which you'll find on page 29 of [The Data Journalist](#).

Notice how much legwork we have done BEFORE any data manipulation. Taking time to understand your data is crucial. Data journalists also call this process interviewing your data, the same way you would a human source.

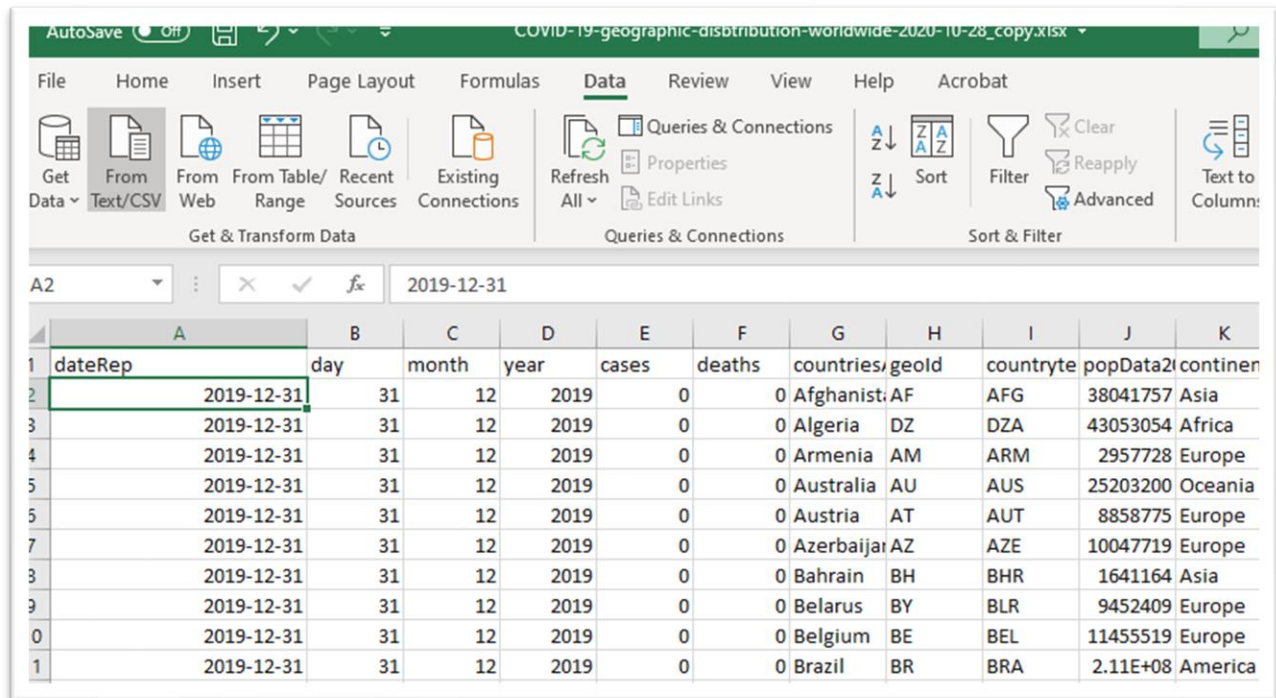

Sorting key columns of information is one of the first things we do during this interviewing process.

## Sorting

The dates in column A are already in descending order. However, if we wanted to sort in ascending order to determine when the centre began collecting the COVID-19 information, we would highlight cell A2, go to “Data” on your menu at the top, and then scroll over to the “Sort & Filter” section.

A to Z is descending order.

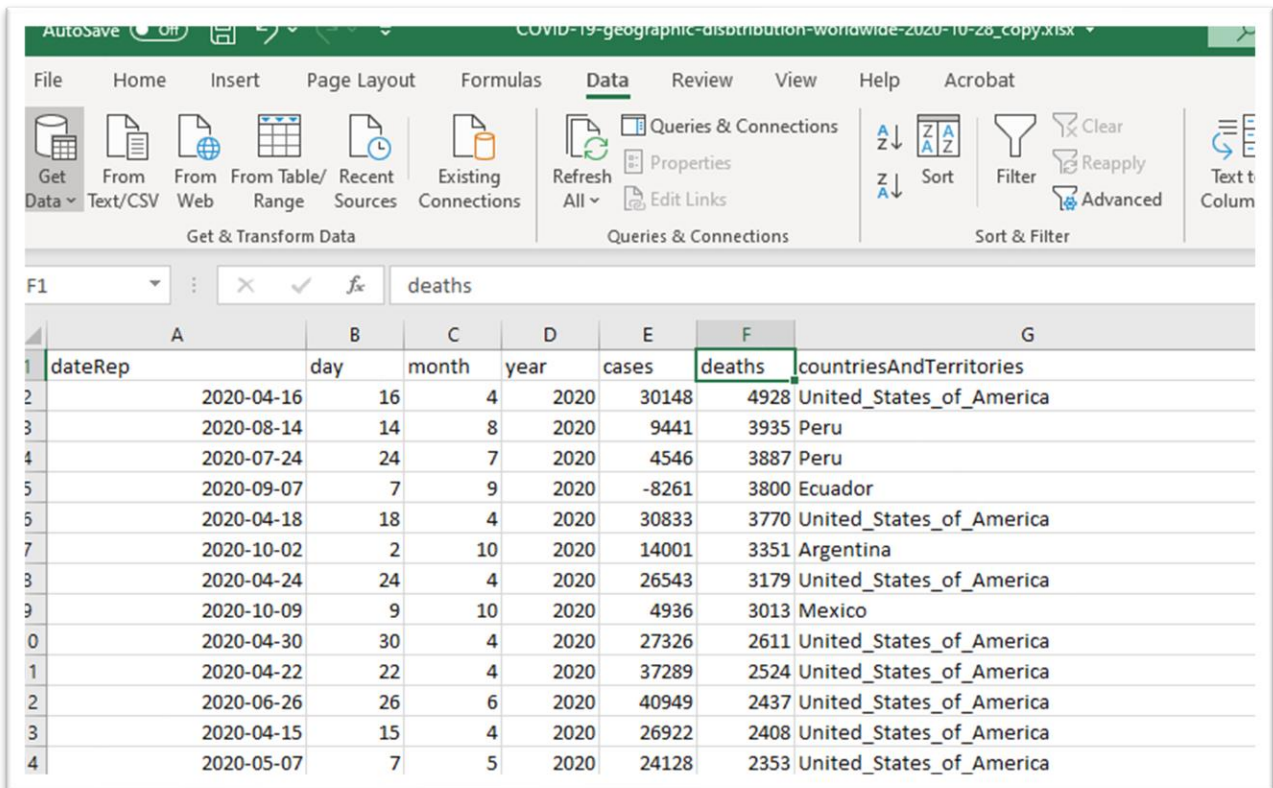

The screenshot shows the Microsoft Excel interface with the 'Data' tab selected. The ribbon includes options for 'Get & Transform Data', 'Queries & Connections', and 'Sort & Filter'. The 'Sort' button is active, indicating the data is sorted. The active cell is A2, containing the date '2019-12-31'. The data table below is sorted by the 'dateRep' column in descending order.

	A	B	C	D	E	F	G	H	I	J	K
1	dateRep	day	month	year	cases	deaths	countries	geold	countryte	popData21	continen
2	2019-12-31	31	12	2019	0	0	Afghanistan	AF	AFG	38041757	Asia
3	2019-12-31	31	12	2019	0	0	Algeria	DZ	DZA	43053054	Africa
4	2019-12-31	31	12	2019	0	0	Armenia	AM	ARM	2957728	Europe
5	2019-12-31	31	12	2019	0	0	Australia	AU	AUS	25203200	Oceania
5	2019-12-31	31	12	2019	0	0	Austria	AT	AUT	8858775	Europe
7	2019-12-31	31	12	2019	0	0	Azerbaijan	AZ	AZE	10047719	Europe
3	2019-12-31	31	12	2019	0	0	Bahrain	BH	BHR	1641164	Asia
9	2019-12-31	31	12	2019	0	0	Belarus	BY	BLR	9452409	Europe
0	2019-12-31	31	12	2019	0	0	Belgium	BE	BEL	11455519	Europe
1	2019-12-31	31	12	2019	0	0	Brazil	BR	BRA	2.11E+08	America

We can see that the data started coming into the centre on December 31.

Now let's sort the "deaths" column in descending order.

The screenshot shows the Microsoft Excel interface with the 'Data' ribbon selected. The 'Sort' button is highlighted in green. The spreadsheet data is as follows:

	A	B	C	D	E	F	G
1	dateRep	day	month	year	cases	deaths	countriesAndTerritories
2	2020-04-16	16	4	2020	30148	4928	United_States_of_America
3	2020-08-14	14	8	2020	9441	3935	Peru
4	2020-07-24	24	7	2020	4546	3887	Peru
5	2020-09-07	7	9	2020	-8261	3800	Ecuador
5	2020-04-18	18	4	2020	30833	3770	United_States_of_America
7	2020-10-02	2	10	2020	14001	3351	Argentina
8	2020-04-24	24	4	2020	26543	3179	United_States_of_America
9	2020-10-09	9	10	2020	4936	3013	Mexico
0	2020-04-30	30	4	2020	27326	2611	United_States_of_America
1	2020-04-22	22	4	2020	37289	2524	United_States_of_America
2	2020-06-26	26	6	2020	40949	2437	United_States_of_America
3	2020-04-15	15	4	2020	26922	2408	United_States_of_America
4	2020-05-07	7	5	2020	24128	2353	United_States_of_America

The U.S. experienced the deadliest day on April 16. Again, this number is an aggregate. For instance, we are still lacking more precise information such as the states in which these deaths occurred, age group, gender, etc.

Still, the aggregate number is a good starting point for research and storytelling.

We can also sort column E to conduct the same kind of analysis for cases.

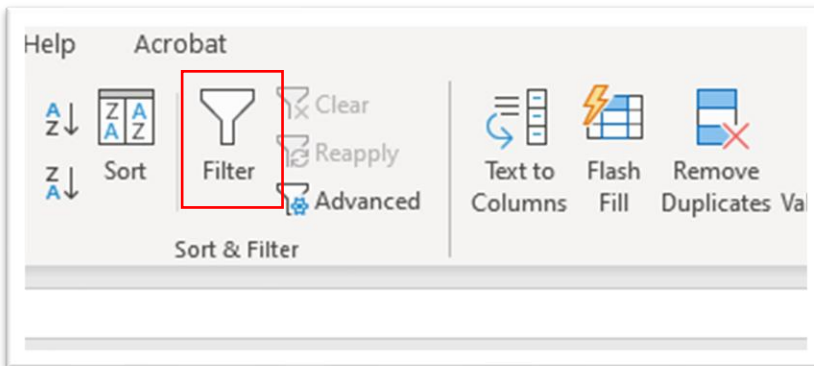

Sorting is useful when dealing with columns containing numbers, because we can go from most to least and vice-versa. It's only useful to sort columns with text if there's a reason to organize information alphabetically, like country names in column G.

We have reached the limit of sorting.

It's time to take a slightly deeper dive into the data by using our filter.

## Filtering

Click any cell in the first row and select the filter icon in the menu's "Sort & Filter" section.

G	H	I	J	K	L
countriesAndTerritories	gold	countryterritoryCode	popData2019	continent	Cumulative_number_for_14_days_of_COVID-19_cases_per_100000
United_States_of_America	US	USA	329064917	America	128.5281427
Peru	PE	PER	32510462	America	309.1435611
Ecuador	EC	ECU	17373657	America	11.59801877
United_States_of_America	US	USA	329064917	America	128.9104301
Argentina	AR	ARG	44780675	America	393.0043484
United_States_of_America	US	USA	329064917	America	122.5104771
Mexico	MX	MEX	127575529	America	47.40956238

Now each column has an arrow that when selected displays the numbers in ascending order.

Filtering allows us to only select certain countries such as Canada and the United States.

This can be accomplished by activating the filter in column G, clearing the selection and choosing Canada and the United States.

The funnel icon in column G1 tells us that “countriesAndTerritories” is now filtered.

We can filter the date column for the most recent day.

Filtering by day is trickier, because we have to drill down to the actual day by clicking the “+” signs next to the Years and months in order to

get to days, as you can see in the screen grab above.

Now we have a snapshot for the United States on Oct 28, 2020, six days before a U.S. presidential election in which COVID-19 has become a major issue. Of course, raw numbers only tell part of the story. Using a death rate would be better, which is possible to calculate because we have the population numbers in column J.

We will cover rates in the next tutorial.

You can practice the steps in this tutorial with data from the federal government's COVID-19 [website](#).
